

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

badly ventilated decks than it was among the others. In all other respects the men were exposed to precisely similar conditions; they wore the same clothes, ate the same food, and all of them slept in hammocks slung very close Thus the experience has the value of a carefully planned experiment in showing the effect of freely moving air as a preventive of infections of this nature. Another striking instance, recorded by Colonel Adami, F.R.S., in the first volume of his book on the "War Story of the Canadian Army Medical Corps," was noted in the review published in the first number for this year. The winter of 1914-15 was very wet, and the troops under canvas on Salisbury Plain suffered extreme discomfort, but nevertheless continued in excellent health. When, after some six weeks, the discomfort of tent life and the increasing cold of winter induced the authorities to replace the tents by huts, then influenza and throat troubles began to spread at once and rapidly, and, what was worse still, a series of cases of cerebro-spinal fever occurred.—The British Medical Journal.

SCIENTIFIC BOOKS

Life Zone Investigations in Wyoming. MERRITT CARY. North American Fauna, No. 42. October 3, 1917, pp. 1-95; pls. I.-XV.; text figs. 1-17.

The Biological Survey has for many years been gathering data on the ecological relations of animals and plants in North America with particular reference to the transcontinental life zones. Several generalized maps of the entire continent have been published, and a series of detailed studies by states and provinces is well under way. The results of some of the latter have already been published, and another is now presented in the present report on Wyoming. This is based on a number of years' field work in the state by the author and other members of the Biological Survey.

In a brief introduction attention is called to the life zones as "a fairly accurate index to average climatic conditions, and, therefore, ... useful as marking the limits of agricultural possibilities, so far as these are dependent upon climate." They are thus valuable as an index to the possibilities of agriculture in undeveloped regions.

With the caption "Physiography and Climate," there is also a description of the varied physiography of Wyoming, which is characterized particularly by mountains, plains and valley basins. This variety of surface produces likewise a varied climate, though mostly cool by reason of the high base level, and arid excepting on the higher mountains.

Under the heading "Life Zones of Wyoming," the transcontinental ecologic belts occurring in the state are treated at length, and a careful account is given of their divisions, if any, their area, altitudes, the most important localities covered by each, their physical and faunal characteristics, and their agricultural possibilities. For each zone there are added long lists of trees, shrubs, herbaceous plants, of mammals, and of breeding birds; mention is made also of reptiles, but of no other vertebrates and of no invertebrates. Doubtless, however, the mollusks and insects would, at least in the main, substantiate the results obtained from the plants and the higher vertebrates. The characteristics of these five zones are so carefully worked out that a summary of the author's conclusions may be worth presenting in this connection.

The Upper Sonoran Zone, which occupies most of the valleys and lower plains, from altitudes of 3,100 to 6,500 feet, is the home of the broad-leaved cottonwood, juniper, salt bush and yucca; of such mammals as Eutamias minimus pictus, Citellus tridecemlineatus parvus, Lepus californicus melanotis; and of such breeding birds as Zenaidura macroura marginella, Tyrannus vociferans, Passerina amana, and Icteria virens longicauda.

The Transition Zone, which embraces the high plains, the basal slopes of the mountains, and all the foothills except the highest, and ranges from altitudes of 4,000 to 8,500 feet, is characterized by yellow pine, narrow-leaved cottonwood, and sage brush; mammals like Odocoileus virginianus macrourus, Sciurus hudsonicus dakotensis, Neotoma cinerea cinerea, and Lepus townsendi campanius; and such breeding birds as Centrocercus urophasianus, Cryptoglaux acadica acadica, Empidonax

wrightii, Cyanocephalus cyanocephalus, and Hylocichla fuscescens salicicola.

The Canadian Zone, which covers the middle mountain slopes and the highest foothill ranges, occurring at altitudes of from 7,500 to 10,500 feet, is the boreal forest belt of spruce, fir, lodgepole pine, and aspen; and is furthermore delimited by such mammals as Alces americanus shirasi, Glaucomys sabrinus bangsi, Phenacomys orophilus, Evotomys gapperi galei, and Lepus americanus americanus; with such birds as Charitonetta albeola, Nuttallornis borealis, Melospiza lincolnii lincolnii, and Sitta canadensis.

The Hudsonian Zone, which is a narrow belt covering the timberline region, and ranging from altitudes of 9,000 to 11,200 feet, is marked chiefly by the white-barked pine, dwarfed spruce and fir; together with such mammals as Ovis canadensis canadensis, Eutamias oreocetes, and Ochotona uinta; and such birds as Nucifraga columbiana and Pinicola enucleator montana.

The Arctic-Alpine Zone, which occupies the mountain crests and the portion of the peaks above timberline, in places from 9,500 to 13,785 feet altitude (the summit of the highest mountain in the State), is a treeless area, the vegetation of which is limited to low bushes like Salix nivalis, and other humble plants like Dryas octopetala and Poa arctica, and is the home of such breeding birds as Lagopus leucurus altipetens, Leucosticte australis, Leucosticte atrata and Anthus spinoletta rubescens.

The term "Upper Sonoran" as used here is really not a zone in the strict sense, and would be better called "Upper Austral," of which zone it is the western arid division. Although no mention is made of the fact, the so-called "Arctic-Alpine Zone" is really a part of the Arctic Region, which, in North America, covers the tundra area of the northern part of the continent and the mountain tops above timberline in the more southern parts of Canada and in the United States; and the four other zones of Wyoming belong to the Nearctic Region.

Following the main part of this bulletin

is a well-annotated list of the conspicuous trees and shrubs of Wyoming that are of importance in the delimitation of life zones. The numerous half-tones illustrate the different types of physiography and the ecological relations of the vegetation. Of particular interest are the pictures of *Picea engelmanni* and *Pipus albicaulis* at timberline, which show the dwarfing and distorting effects of the severe climatic conditions under which they here live.

The author's careful and detailed treatment of this extremely interesting and intricate subject leaves little to be desired; and it is a matter of great regret that he could not have lived to carry his investigations into other parts of the United States.

HARRY C. OBERHOLSER

SPECIAL ARTICLES

A CHART OF ORGANIC CHEMISTRY, ALIPHATIC SERIES

In connection with the elementary organic chemistry course given at the university I deemed it advisable to have charts made to be placed in the lecture and laboratory rooms, where students may consult them at all times. In order to emphasize certain endings, type groups, etc., red lettering was used.

The chart, which is 92" x 55", is reproduced on the preceding page.

An analogous chart of the aromatic series is in course of preparation.
